Global analysis of the mRNA, protein, and metabolite responses to spaceflight across all GeneLab data (Figures 1A–1D; Table S1) was performed by calculating the average number of differentially detected molecules between in-flight (FLT) and ground control (GC) samples. We found that cultured human cells and primary human hair follicles had the strongest response to spaceflight than other ...

We'll select and perform the optimal JOIN for a data science inquiry and clean data within an analysis dataset by deduping, running quality checks, backfilling, and handling nulls. We'll learn how to segment and analyze data per segment using windowing functions and use case statements to execute conditional logic to address a data science inquiry.
